蝙蝠 Bats

蝙蝠是香港唯一一種能真正飛行的哺乳類動物。牠們的「翼手」由手指、前臂和飛行翼膜組成。蝙蝠屬夜行性動物，大部分還會使用回聲定位的本領。在香港發現的蝙蝠品種中，大部分捕食昆蟲，其他則以吃果實、花蜜和魚類為生。

Bats are the only group of mammals that possess the ability to fly. Their "hand-wings" are formed by forelimbs, digits and flight membrane. Bats are nocturnal and most of them are capable of echolocation. Among the bats species discovered in Hong Kong, most are insectivorous while others prey on fruits, nectar and fishes.
